Integrating the Quotation page with your site

Introduction

Until June 2014, for customers to obtain a quote for your service, it was necessary to redirect the customer to the Instant-Quote.co site. This is no longer a requirement.

Using cross-site JavaScript, customers with their own domain can now embed the quotation functionality within their own web pages giving the end customer a seamless experience when obtaining a quote.

The items displayed on the form can be configured from the administrative interface.

Security

The system uses the security built into the IETF standards to identify your web site and return the appropriate data.

Key features

- The web page displays available assets.
- Selecting a date from the calendar updates the asset list based on availability.
- Customised field titles and required fields are set form the quotation page interface (Under 'Configuration').
- The map is centred on your organisation.
- Your duration configuration from your host configuration is displayed.
- The map is centred on the location of each asset as it is selected.
- Assets are filtered based on the geographic location of the pickup.
- The journey requested is checked and displayed on the map. (Google API key required.)
- Address entry uses Google Maps - Places autocomplete.
- Quotes are delivered by email.
- Images can be viewed as a navigable gallery.
- Tooltips display further information regarding an item – such a passenger capacity.
- The layout and style can be customised by your web designer.
- A datasheet for each item can be displayed.

Note: The image size changes depending on the number of items returned. Small images are returned when over 6 items are available and medium images when 6 or fewer items are returned.

Note: Only items with the same post / zip code can be quoted in a single quote. This is as a result of limitations imposed by the Google Maps API.

Default implementation

The quotation page can be embedded into any standard HTML page.

All of the required code is contained in a single <div> element (`id="IQcontent"`) although even that can be customised should you wish – however, although you may wish to reorganise the elements, they are all required.

The entirety of the layout (where possible) is contained in the linked CSS file `quotepage.css` which can be omitted if you wish to customise colours and sizes.

To create the page

The first step is to create a new page in the style of your site.

Typically this would have a standard header and background and possibly footer.

The second step is to **add the following code to the head section**, that's anywhere between `<head>` and `</head>`

```html
<title>Instant-Quote Quotation</title>
    <!-- Replace the Title and Description content with your own text -->
    <meta name="description" content="Instant Quote provides a real-time quotation and booking service for wedding
transport companies.">
    <meta http-equiv="content-type" content="text/html;charset=UTF-8">

<link rel="stylesheet" href="https://www.instant-quote.co/javascript/prettyphoto3/css/prettyPhoto.css" type="text/css"
media="screen" />
    <link href="https://www.instant-quote.co/Scripts/zebracss/default.css" rel="stylesheet" />
    <link href="https://www.instant-quote.co/css/responsivequotepage.css" rel="stylesheet" />
    <link rel="stylesheet" href="//code.jquery.com/ui/1.12.1/themes/smoothness/jquery-ui.css" />

    <script type="text/javascript" src="https://www.instant-quote.co/javascript/json2.min.js"></script>
    <script type="text/javascript" src="https://www.google.com/jsapi"></script>
    <script src="https://www.instant-quote.co/javascript/spin.min.js"></script>

    <!--Select the correct link for Google Maps your country-->
    <!-- Be sure to comment out the rest! -->

    <script type="text/javascript"
src="https://maps.googleapis.com/maps/api/js?v=3.exp&amp;libraries=geometry,places&amp;region=GB"></script>
    <!--
    <script type="text/javascript"
src="https://maps.googleapis.com/maps/api/js?v=3.exp&amp;libraries=geometry,places&amp;region=US"></script>
    <script type="text/javascript"
src="https://maps.googleapis.com/maps/api/js?v=3.exp&amp;libraries=geometry,places&amp;region=NZ"></script>
    <script type="text/javascript"
src="https://maps.googleapis.com/maps/api/js?v=3.exp&amp;libraries=geometry,places&amp;region=CA"></script>
    <script type="text/javascript"
src="https://maps.googleapis.com/maps/api/js?v=3.exp&amp;libraries=geometry,places&amp;region=AU"></script>
    -->
    <!-- If you have an Api key for Google maps insert it in the url using &amp;key=abc123 -->

    <!-- End of map country selection -->
    <script type="text/javascript" src="https://www.instant-quote.co/javascript/json2.min.js"></script>
    <script src="https://www.instant-quote.co/javascript/spin.min.js"></script>
```

Note: Check there is not already a reference to common scripts such as jQuery. We support jQuery 1 & 2.

Links to Google maps for five countries are provided. Use the link terminating with your region code for example 'GB' for United Kingdom 'US' for the USA, 'CA' for Canada etc. Comment out or delete the others.

The map can display a customer's chosen route but for that you will require a Google Maps API key. This can be obtained for free from Google. (Search for: `get google maps api key.`)

The next step is to add the following code to the body section, that's anywhere between `<body>` and `</body>`. Where you place it will, of course, determine where it will appear on the page, so after your standard page header and before the standard footer – if you have one – would seem the most likely place.

```html
 <!-- You should force the host used  by uncommenting the line below and changing the value form "0" to your host id.
-->
    <!--<input type="hidden" name="hfhost" id="hfhost" value="0">-->
<!-- To change the number of items displayed on a page before paging occurs, enter the number of items in the value
field below. -->
```

```html
<!--<input type="hidden" name="hfcount" id="hfcount" value="20"> -->
<!-- If you are running a directory, enter the your host_id here.-->
<!-- <input type="hidden" name="hfdir" id="hfdir" value="0">-->

<div id="IQcontent">
    <div id="IQcalendar">
        <form id="IQform" action="javascript:calcRoute(event);" class=" iqform">
            <div id="IQhelpline">Help line: </div>
            <hr style="clear:both;"/>

            <div lang="en-gb">
                <h4>1 &#8211; Select the event date</h4>
            </div>

            <div>
                <div>Date:</div>
                <div>
                    <input id="eventdate" type="text" class="datepicker" style="width:120px;" />
                </div>
            </div>

            <div><p></p></div>

            <div style="float:left;">

                <div id="lbltime">
                    Start
                </div>

                    <select id="cmbpickup" style=" padding: 4px;  border-radius: 6px;">
                        <option value="00:00">00:00</option>
                        <option value="00:30">00:30</option>
